DRY FABRIC
PERMANENT TECHNOLOGY

DRICOMFORT® GEO 365 is a permanent wicking and fast drying (thermal regulating) technology developed with embedded minerals that enhances comfort and performance all year around. These inherently hydrophilic (water absorbing) and conductive (energy absorbing) mineral particles pull moisture and heat from the skin. GEO uses the body's energy to make heat-carrying sweat evaporate at a faster rate, enhancing evaporative cooling of fabrics.

Fabrics infused with DRICOMFORT® GEO 365 technology are appropriate for all four seasons providing moisture management and thermal regulation in winter base layers or summer fishing shirts, keeping you comfortable 365 days a year.

DRICOMFORT® GEO 365 can be infused into filament polyester as well as nylon knit or woven fabrics - regular, recycled and biodegradable contents - during the dyeing process without impact to hand feel, color or the ability to be recycled.

DRICOMFORT® GEO 365 is not a chemical finish or topical coating that washes out. The infused mineral particles are part of the fiber structure, extending the use and life of the garment with a permanent performance.
