

THE WOOL MILL

This wool mill was founded in Prato some 50 years ago, and thanks to Piero Bacagli's studies and technological inventions, the fur fabric sector was set up for the production of eco furs, linings and fabrics in general.

Great commitment and hard work led them to become one of the world's top textile producers, followed by a turning point: investment in research, innovation and creative ideas. In 1985 "Pile" (fleece), a fabric with extraordinary technical characteristics, becomes a reality.

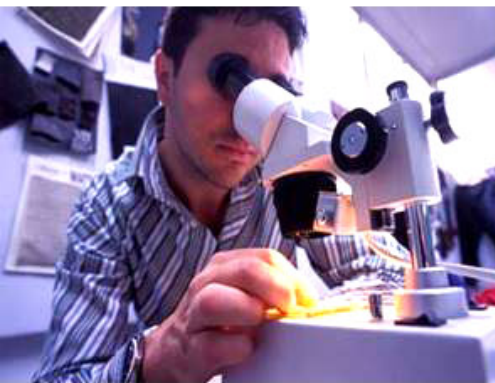

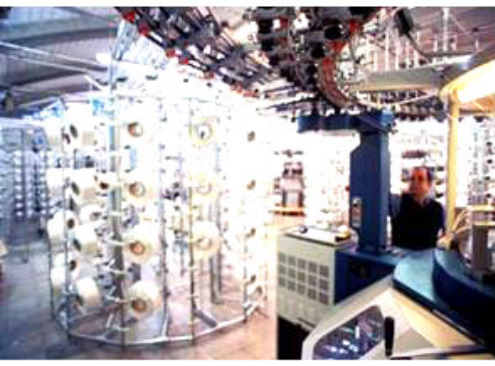

Lanificio Becagli specialises in this production, builds on unique and particularly advanced experience and adds this product to its successes on the national and International market.

The year 2000 sees Lanificio Becagli backed by the strength of their avant-garde mechanical structure throughout the different production stages, the result of continuous investment and research aimed at acquiring the most advanced technology, and by a veritable wealth in human terms which can boast the highest level of specialisation in the development and control of the various production processes.

Lanificio Becagli faces the new millennium with the impetus of their unique know-how, by now confirmed and appreciated world-wide, so much so that their fabrics are used by many leading sportswear manufacturers in the various relevant technical sectors.

As part of the Constant renewal applied to this great tradition and historical culture through the years, new currents are introduced, looking at both short-term and long-term plans, including the development of additional client and consumer services.

Added to this, a great willingness to comply with clients creative requests, with clothing manufacturers and also with the growth of the company's internal development regarding both fabric design and innovation linked to the care of the same fabrics under normal use.

IL LANIFICIO

Il lanificio Becagli has recently developed a new service for its customers, through one branch of our group: special dyeings, sprayed treatments, and various other chemical and mechanical treatments on the finished garments, joining the experiences of our chemical laboratory with those of two of the leading mills in this sector. Prototyping, sample, services and final treatments are available for our customers.
