FY18142-1

T8 dryflex – woven mesh

FY18142 – ultra stretch and breathable
 One of the yarn was melted during the dying process, and left millions holes in the fabric, to allow the air go through freely, to offer the ultra airy feeling.
 The coil structure of T8 fiber has a lot of micro space to allow the moisture spread quickly, which can keep you dry.

Technology

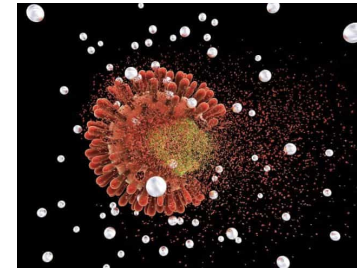

How it works?

Antivirus:

The anti-virus agent can bind to the envelope protein of virus surface, make the virus inactive, further destroy the envelope, so that the virus can not be infected.

Virus blocking:

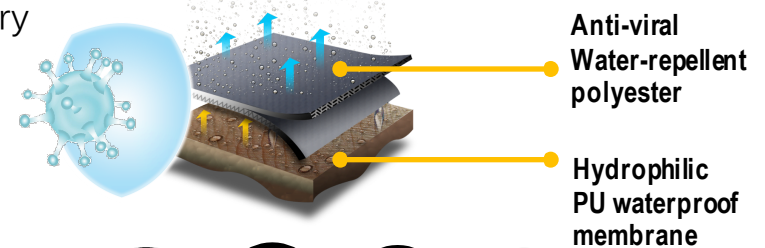

The hydrophilic membrane can block and filter virus completely.

Antiviral effect

There is no commercial testing center currently has a COVID-19 strain available for testing, but tests can be performed using another coronavirus, H1N1, which also belongs enveloped virus.

According to the latest international test standard ISO18184-2019, the test results of the anti-virus finished fabric show that it is **99.9%** virus reduction in 2 hours and it is still effective after home laundry

BIOFUZE® bio-degradable polyester by embedding a catalyst to the polymer which accelerates the bio degradation in landfills by attracting microbes to decomposed it. Over 25% biodegradation took place in less than 5 months (ASTM D5511) while a regular polyester fabric would degrade only 0.6%

Tencel cellulosic fiber originates from the renewable wood from forest. And certified as compostable and biodegradable. 90% was degraded within 6 months (EN14046). Thus it can fully revert back to nature.
